Executive Summary

Aploy is an autonomous job search and application intelligence platform built for software developers and technology professionals. Where every existing tool waits for the job seeker to find opportunities manually and then helps organize them, Aploy reverses the dynamic entirely. It discovers jobs, scores them against the user's unique skill profile using artificial intelligence, tailors their resume, generates a cover letter, and pre-fills the application form. It does all of this continuously, around the clock, without being asked.

The platform operates in the background and interrupts the user only when a genuinely strong opportunity has appeared. A companion iOS application ensures that high-score alerts reach the user instantly, wherever they are. Every final decision remains with the human. Aploy prepares everything and asks for approval before a single application is submitted.

Year 3 ARR target

Aploy is currently in active development. The founding builder is a web developer with hands-on experience in React, Next.js, TypeScript, and Supabase. The initial target market is software developers at all experience levels, with a clear roadmap to expand into all technology and knowledge-worker roles. The business operates on a freemium SaaS model with a twelve-dollar-per-month Pro tier and a seventy-nine-dollar lifetime access option.

Aploy is not a job tracker. It is an always-on career agent that finds opportunities you would have missed, prepares your application automatically, and only asks for your attention when something genuinely worth your time has appeared.

02

Company Overview

Company Name	Aploy
Product Type	SaaS — Autonomous Job Search Platform
Founded	2026
Stage	Pre-Seed / Self-Funded
Primary Market	Software Developers and Technology Professionals
Geography	Global (English-speaking markets first)
Revenue Model	Freemium SaaS — Monthly Subscription and Lifetime Access
Website	aploy.com (domain secured)
Mobile App	iOS — Phase 8 of development roadmap

Mission

To remove every preventable barrier between a skilled developer and the job they deserve, by replacing manual job hunting with an intelligent, automated system that works tirelessly on their behalf.

Vision

A world where the quality of your skills determines your career trajectory, not the hours you can afford to spend searching or the size of your professional network. Aploy makes the job market more meritocratic by giving every developer access to a systematic advantage that was previously unavailable to anyone.

Core Values

Autonomy. The system works so the user does not have to.

Precision. Every output is specific to the role, not generic.

Transparency. The user sees exactly why a job scored the way it did and approves every action.

Equity. Powerful career tools should not be reserved for candidates with elite networks.

03

Problem Statement

The Current Reality

Finding a job as a software developer in 2026 is a full-time job in itself. Despite living in an era of powerful automation and machine learning, the job search process has not fundamentally changed in two decades. Developers still open the same websites manually, read listings one at a time, rewrite their resume for each application, compose cover letters that sound nearly identical to the last, and submit into silence.

The Daily Workflow of a Job Seeker

01	Open LinkedIn, Wellfound, Indeed, and company career pages in separate browser tabs.
02	Scroll through dozens of listings. The majority are irrelevant within the first sentence.
03	Read each description to assess fit. Repeat this across every source, every day.
04	Adjust a resume, hoping the keywords align with what the ATS system is scanning for.
05	Write a cover letter that still reads as generic despite the effort put into it.
06	Fill out an application form, manually re-entering information already on the resume.
07	Update a tracking spreadsheet that will be outdated within twenty-four hours.
08	Repeat every single day for weeks or months, with diminishing emotional energy.

Quantifying the Problem

Metric	Data Point	Source
--------	------------	--------

Average job search duration	3 to 6 months	LinkedIn Workforce Report
Hours spent per week on search tasks	10 to 20 hours	Indeed Job Seeker Survey
Applications submitted per offer	100 to 200 or more	Jobscan Research
Generic resume callback rate	Below 25 percent	The Ladders Resume Study
Time spent on non-interview tasks	Over 80 percent of total	Aploy Internal Analysis
Job seekers reporting burnout	Over 70 percent	Mental Health at Work 2025

Why Existing Tools Have Not Solved This

Every tool in the current landscape has digitized the problem rather than solved it. Huntr, Teal, and Simplify are application trackers. They require the user to find jobs first. JobScan analyzes resumes only after the user has already identified a role. MyJobFlow reads inbox confirmations, meaning you must apply before it tracks anything. Not one of these tools is active. Not one works while the user is offline. Not one reduces the hours spent searching by a single minute.

The gap in the market is not an organizational tool. It is an active agent that finds, qualifies, and prepares opportunities without being asked.

04

Solution

Aploy replaces the entire manual job search workflow with an intelligent, automated pipeline that operates continuously in the background. The platform moves each job listing through seven sequential phases, from raw discovery through to a prepared, reviewed application.

01	Discovery	Automated workflows scan developer-focused job boards and company career pages multiple times per day. Every new listing is captured and stored before the user is ever aware of it.
02	Filtering	Raw listings pass through rules-based filters that remove roles which do not match the user's defined criteria, including seniority level, industry, location, and technology stack.
03	AI Scoring	Each filtered listing is analyzed by an AI model that compares the job description to the user's skill profile. The model returns a score from 1 to 10 with a clear explanation of exactly why the role ranked where it did.
04	Notification	When a listing exceeds the user's defined score threshold, an instant alert is dispatched via Discord, email, or push notification. The alert includes the company name, role title, score, and a direct application link.
05	Resume Tailoring	For approved listings, the AI extracts key requirements from the job description and generates a version of the user's master resume that emphasizes the most relevant experience. The result is exported as a polished, formatted PDF.
06	Cover Letter	A targeted cover letter is generated using the job description and the user's background. The letter is specific enough to read as genuinely human-written and is available for review and editing before use.

07 Application

Browser automation opens the application page, fills in standard form fields, uploads the tailored resume, and pauses for final review. Nothing is submitted without the user's explicit approval.

The iOS Mobile App

A companion iOS application written in Swift connects directly to the Supabase backend. The app allows users to browse scored listings, approve or reject opportunities, read generated resumes and cover letters, and receive push notifications for high-scoring matches from anywhere. The app does not require the user to visit any job board. Everything it displays has already been collected, filtered, scored, and prepared automatically.

05

Market Opportunity

Total Addressable Market

The global online recruitment software market was valued at approximately 3.1 billion dollars in 2025 and is projected to reach 5.4 billion dollars by 2030 at a compound annual growth rate of 11.8 percent. Aploy operates on the job-seeker side of this market, a segment historically underserved and undermonetized relative to recruiter-facing tools.

Serviceable Addressable Market

There are approximately 27 million professional software developers globally as of 2026, with an estimated 4 to 5 million actively seeking new roles at any given time. If 10 percent of active seekers adopt a paid tool at 12 dollars per month, the serviceable market represents 60 million dollars in annual recurring revenue. Developer tools are among the highest-converting software categories because the audience understands the value of automation and will pay measurably for tools that save them time.

Serviceable Obtainable Market

In the first three years, Aploy targets 5,000 paying users. This is less than 0.02 percent of the global active developer job-seeker pool — a target that requires no viral growth, no enterprise sales, and no paid advertising beyond organic community engagement. At 5,000 users on the 12-dollar Pro tier, Aploy generates 720,000 dollars in annual recurring revenue.

Tier	Definition	Size	Aploy Position
TAM	Global recruitment software market	\$3.1B	Industry benchmark
SAM	Developer-focused job seeker tools	\$600M	Direct market
SOM Year 1	Early adopters via organic channels	\$43K ARR	Launch milestone
SOM Year 2	Community and word-of-mouth growth	\$288K ARR	Growth milestone
SOM Year 3	Established platform at 5,000 users	\$720K ARR	Three-year target

Market Tailwinds

- + Remote work normalization has expanded the pool of eligible roles for every developer, raising competition per posting and making smart filtering significantly more valuable.
- + AI-assisted professional tools have created strong consumer familiarity with automation in career-related tasks, reducing adoption friction for a product like Aploy.
- + Technology sector layoffs from 2023 through 2026 have meaningfully increased the number of skilled developers in active job searches at any given time.
- + Applicant tracking systems have made generic applications even less effective, driving strong demand for tailored resume tooling at scale.
- + The developer community spreads software tools rapidly through GitHub, Hacker News, Reddit, and Twitter, enabling organic growth without paid acquisition.

Product and Technology

Technology Stack

Layer	Technology	Purpose
Automation Engine	n8n	Orchestrates all scheduled workflows, triggers, and data pipelines
Database	Supabase (PostgreSQL)	Stores all jobs, user profiles, scores, resumes, and status records
AI Intelligence	OpenAI GPT-4o	Job scoring, resume tailoring, cover letter generation
Web Dashboard	Next.js + Tailwind CSS	Primary interface for job review and application management
PDF Generation	React PDF	Produces formatted, downloadable tailored resume documents
Browser Automation	Playwright	Pre-fills and stages application form submissions
Mobile App	Swift (iOS)	Companion app for on-the-go review and push notifications
Authentication	Supabase Auth	Secure accounts, sessions, and row-level access control
Notifications	Discord / Email / APNs	Real-time high-score match alerts across all platforms

Security and Privacy

All user data is stored in isolated Supabase instances with row-level security enabled, ensuring no user's data is ever accessible to another. Credentials for external services are stored as encrypted environment variables and never exposed in application code. Aploy does not sell, share, or analyze user data for any purpose other than operating the user's own pipeline. Authentication uses industry-standard OAuth 2.0 and JWT tokens.

Scalability

The system is architected for horizontal scaling from day one. Workflows are stateless and replicable. Supabase scales automatically on managed infrastructure. The OpenAI API has no rate-limit concerns at early user volumes. When self-hosting n8n becomes cost effective at scale, the migration path is

clean with no architectural changes required.

07

Business Model and Revenue

Aploy operates on a freemium SaaS model with three tiers designed to support a wide acquisition funnel while capturing strong revenue from power users.

FREE	PRO	LIFETIME
\$0	\$12	\$79
per month	per month	one-time
+ Job discovery and collection + Basic role filtering + Web dashboard access + Up to 50 active job listings + Direct application links	+ Everything in Free + AI relevance scoring + Resume tailoring per role + AI cover letter generation + Real-time alerts via Discord and email + iOS mobile app access + Application pre-fill automation + Up to 500 active listings + Priority support	+ Everything in Pro + No recurring payments ever + All future features included + Earliest access to new releases + Direct founder support channel

Revenue Drivers

Free to Pro Conversion. The Free tier demonstrates enough value to earn trust but limits enough to drive upgrades. AI scoring is the primary conversion trigger. Once users see scored results, manual filtering becomes unacceptable.

Lifetime Tier as Launch Fuel. The 79-dollar lifetime option generates strong upfront cash at launch and creates vocal advocates with financial stake in the platform's success.

Referral Growth. Existing users who refer a paying subscriber receive extended Pro access at no cost. Developer communities spread tools through direct recommendation, and a referral loop accelerates growth without paid advertising.

08

Competitive Analysis

Capability	Aploy	Huntr	Teal	Simplify	ViserLab
Automatic job discovery	Yes	No	No	No	Partial
AI relevance scoring	Yes	No	No	No	Yes
Resume tailoring per role	Yes	No	Partial	No	Yes
AI cover letter generation	Yes	No	Partial	No	No
Real-time job alerts	Yes	No	No	No	No
Application pre-fill automation	Yes	No	No	Partial	No
iOS mobile app	Yes	No	No	No	No
Works while user is offline	Yes	No	No	No	No
Managed SaaS (no self-hosting)	Yes	Yes	Yes	Yes	No

Aploy is the only platform in this landscape that operates autonomously, works while the user is offline, and ships a native iOS application. The closest competitor by feature set, ViserLab's platform, is a self-hosted script sold as a one-time purchase. It is not a managed product, not a mobile application, and not accessible to non-technical users.

Go-to-Market Strategy

Phase 1 — Build in Public (Months 1 to 3)

From day one, progress updates, technical decisions, screenshots, and lessons learned are shared publicly on Twitter, Reddit, and Hacker News. This creates an audience before the product exists and generates organic interest at zero cost. Developer communities rally around builders who show their work.

Phase 2 — Closed Beta (Month 3 to 4)

The first version is offered free to 50 to 100 developers who followed the build-in-public journey. Their feedback directly shapes the first production release. Beta users who convert to lifetime access at a 49-dollar founder rate provide early revenue and long-term advocacy.

Phase 3 — ProductHunt Launch (Month 4 to 5)

A ProductHunt listing targets the developer and SaaS community on the same day the product becomes publicly available. A polished listing with a strong demo video consistently drives thousands of unique visitors to developer tools in the first 48 hours at no cost.

Phase 4 — Community and Content Growth (Month 5 Onward)

Ongoing engagement in developer communities including *r/cscareerquestions*, *r/webdev*, and *r/reactjs*, combined with GitHub discussions and a lightweight content strategy around job search automation, drives sustained organic growth. Referral incentives allow users to earn extended Pro access by sharing the platform with colleagues.

Channel	Cost	Expected Reach	Est. Conversion
Build in Public	Time only	1,000 to 5,000 followers	3 to 5 percent
ProductHunt Launch	Time only	2,000 to 10,000 visitors	2 to 4 percent
Reddit Communities	Time only	Sustained organic	1 to 3 percent
Referral Program	Low	User-driven	5 to 8 percent

SEO and Content	Low	Grows over 12 months	1 to 2 percent
-----------------	-----	----------------------	----------------

10

Development Roadmap

**Stage
1****Foundation**

Days 1 to 2

Configure Supabase schema and n8n automation environment. Establish project repository.

**Stage
2****Job Collection**

Days 3 to 4

Connect job board sources. Build first automated collection workflow. Implement filtering.

**Stage
3****AI Scoring**

Days 5 to 6

Integrate OpenAI API. Build scoring pipeline. Tune prompts against real job listings.

**Stage
4****Notifications**

Day 7

Set up Discord and email alerts. Define score threshold triggers for notifications.

**Stage
5****Dashboard**

Days 8 to 10

Build Next.js review interface connected to Supabase. Job browsing, filtering, and status management.

**Stage
6****Resume Tailoring**

Days 11 to 12

AI resume customization workflow. React PDF integration for polished document export.

**Stage
7****Application Automation**

Days 13 to 15

Playwright browser automation for form pre-fill. Manual review checkpoint before submission.

Stage 8	iOS App	Days 16 to 21
Swift iOS app connected to Supabase. Push notifications, job browser, and approval workflow.		
Stage 9	Public Launch	Day 22 onward
Internal testing, ProductHunt launch, community outreach, and continuous iteration.		

11

Financial Projections

The following projections assume no paid advertising, no external fundraising, and no viral growth events. All growth is attributed entirely to organic channels including build-in-public content, a ProductHunt launch, and developer community word of mouth.

Year 1 — Build and Launch

Quarter	Paid Users	MRR	Costs	Net
Q1	0	\$0	\$80	-\$80
Q2	80	\$960	\$350	+\$610
Q3	220	\$2,640	\$600	+\$2,040
Q4	300	\$3,600	\$750	+\$2,850
Full Year		\$43,200	\$10,560	+\$32,640

Year 2 — Growth

Quarter	Paid Users	MRR	Costs	Net
Q1	500	\$6,000	\$1,200	+\$4,800
Q2	900	\$10,800	\$1,800	+\$9,000
Q3	1,400	\$16,800	\$2,600	+\$14,200
Q4	2,000	\$24,000	\$3,500	+\$20,500
Full Year		\$288,000	\$54,840	+\$233,160

Year 3 — Scale

Quarter	Paid Users	MRR	Costs	Net
Q1	2,800	\$33,600	\$5,000	+\$28,600
Q2	3,500	\$42,000	\$6,200	+\$35,800
Q3	4,200	\$50,400	\$7,400	+\$43,000
Q4	5,000	\$60,000	\$9,000	+\$51,000
Full Year		\$720,000	\$103,200	+\$616,800

Operating Cost Structure

Cost Item	Early Stage	At 5,000 Users
Supabase (managed database)	\$25/mo	\$400/mo
n8n (cloud or self-hosted)	\$50/mo	\$300/mo
OpenAI API usage	\$100/mo	\$5,000/mo
Domain and SSL certificates	\$2/mo	\$2/mo
Vercel hosting	\$20/mo	\$200/mo
Apple Developer Account	\$8/mo amortized	\$8/mo amortized
Miscellaneous	\$25/mo	\$300/mo
Total Monthly	~\$230/mo	~\$6,210/mo

12

Risks and Mitigation

Job Board Access

Risk

Major platforms including LinkedIn actively block automated scraping and prohibit it in their terms of service.

Mitigation

Aploy uses official APIs, aggregator services such as Apify and the Arbeitnow API, and RSS feeds where available. LinkedIn is not a primary dependency.

OpenAI API Cost at Scale

Risk

At high user volumes, per-request AI costs could compress margins if left unmanaged.

Mitigation

Prompt caching, batched processing during off-peak hours, and routing simpler scoring tasks to smaller models keeps costs proportional to revenue.

Browser Automation Fragility

Risk

Application pages change frequently. Automation that works today can break after a site update.

Mitigation

Aploy targets ATS platforms with stable structures including Greenhouse, Lever, and Workday. A breakage monitoring system alerts when automation fails so it can be repaired quickly.

Large Competitor Entry

Risk

LinkedIn, Indeed, or a well-funded startup could build a similar feature set with far greater resources.

Mitigation

Aploy's advantage is speed and community. A large platform building autonomy takes years of internal bureaucracy. Aploy is already building. A devoted developer community is the most defensible moat.

AI Output Quality**Risk**

Poorly tuned prompts can produce generic or inaccurate resume tailoring that damages the user's applications.

Mitigation

Every AI output is reviewed by the user before use. Prompt engineering is treated as a core product discipline with ongoing testing and iteration cycles.

Regulatory Changes**Risk**

Changes to GDPR, CCPA, or job board terms of service could limit data collection practices.

Mitigation

Aploy stores only data the user explicitly authorizes. Legal review of data handling practices is planned before any public launch involving user data.

The Vision

Job searching has not fundamentally improved in twenty years. Developers still open the same websites, read the same listings manually, write the same cover letters, and wait in the same silence. The tools that exist today organize the problem. Aploy eliminates it.

The long-term vision for Aploy is not simply a better job board or a smarter application tracker. It is an intelligent career agent — one that understands a developer's goals, tracks the market on their behalf, prepares them for every opportunity, and advocates for their value in every interaction with a prospective employer.

For the individual developer, this means less time searching and more time preparing. For a bootcamp graduate competing against hundreds of applicants, it means access to the same systematic advantage previously reserved for candidates with elite networks. For a senior engineer quietly exploring better opportunities while currently employed, it means a system that monitors the market continuously without requiring daily attention.

We are not building a feature. We are building an agent. One that works without being asked, alerts without noise, and prepares without hesitation. The job search ends here.

This document is prepared for informational purposes. All financial projections are estimates based on conservative assumptions and are subject to change as the business develops.
